CODEFYHUB WORKFLOW

SECURE NETWORKING

WireGuard VPN Deployment Workflow (AmneziaWG)

Standard operating procedure for securely deploying the self-hosted company VPN to users across supported operating systems.

VERIFIED
Nov 1, 2026 by Codefyhub Operations

Objective

Deploy a working VPN profile without exposing private configuration or weakening access controls.

Preconditions

- Administrator access to the approved VPN console
- A verified user and device request
- An approved secure delivery channel

Admin workflow

1. Open the client management console.
2. Create a clearly identifiable client name.
3. Generate the configuration and record the change ticket.

> Warning: Never publish QR codes or configuration files. They contain sensitive cryptographic keys.

Validation

Run the connection test and confirm the expected egress address:

```
curl --fail --silent https://ifconfig.me
wg show
```

User workflow

1. Install the approved AmneziaWG application.
2. Import the delivered configuration.
3. Activate the profile and complete the validation check.

Rollback and recovery

Revoke the affected client, confirm it can no longer connect, and issue a new profile only after the incident owner approves recovery.

Evidence retained

- Request and approval record
- Client identifier
- Validation result
- Revocation record when applicable

Verified sources
